FARMER'S RELIABLE DIRECTORY

## A Bank for Farmers and Business Men

THE services of the Shelby County State Bank and the protection it affords farmers and business men are unequalled in Shelby County. You need a bank account on which to draw checks, an account to draw interest, a safety deposit box to safeguard your deeds, mortgages or other valuable papers, or some other form of service we supply.

Come in and see us, and let's talk it over. We are always glad to give a friendly explanation of this bank's ability and desire to co-operate with you.

# DELCO-LIGHT

ELECTRICITY FOR EVERY FARM.

Make Your Home Modern With

 **Delco-Light** 

Have—

Bright, Safe Electric Lights in the home.

Electric Power for household and farm machinery.

An electric water system with running water for modern bathroom, kitchen, laundry, sprinkling and stock.

Electric Heat for flat iron, toaster, percolator, warming pads.

A modern country home will hold the boys and girls on the farm. Delco-Light betters living conditions and pays for itself.

More than 50,000 Delco-Light plants in the homes of satisfied users on the date this book was published.

Investigate Delco-Light. Learn how it makes a modern home possible. The booklet tells about it. Call or write for it.

## Introduction

**I**N this directory we have endeavored to give Shelby county farmers a complete and reliable directory of the farmers, breeders and merchants of the county, with such other information as will make the directory a valuable reference book.

The task of calling on every farmer in a county and collecting the information for such a directory is a tremendous one. We have received splendid co-operation from the farmers and business men of the county, without which the publication of such a directory would be impossible. In a very few cases we have found farmers unwilling to give the information requested, which accounts for a few names that do not appear.

A few mistakes are bound to occur in a directory that involves so large an amount of work, but we have spared no effort or expense to make the information complete and accurate, and we believe that the mistakes are very few.

We want to speak a word of appreciation for the advertisers whose liberal support has helped materially to bear the heavy expense of publishing this directory, and ask that you favor them with your patronage whenever possible.

We hope and believe that the publication of this directory will be a real service to Shelby county farmers and in line with PRAIRIE FARMER's policy of service to the farmers of Illinois. We hope that the increased circulation of PRAIRIE FARMER in Shelby county, which has resulted, will help in the movement for better farming, better farm living, and more prosperity for the counties, and that our many new friends will become permanent members of the big PRAIRIE FARMER family.

BURRIDGE D. BUTLER,

## BINDER TROUBLES AND ADJUSTMENTS

By C. O. Reed, University of Illinois, in Prairie Farmer.

To have to await the services of an expert when every minute of the harvest days is money is not only an expensive practice, but in most cases is an unnecessary one if the operator will only use patience and good judgment and try to understand a few very simple principles of what seems a complicated machine. The purpose of this article is to aid the operator in his most common binder troubles. To cover the ground in the most logical and concise manner, let us consider troubles under the three general heads: general binder troubles, binder head troubles and knoter head troubles.

**Starting.** If possible, start the new machine on a road or in a pasture before going into the grain field. Use plenty of kerosene and run the machine empty for about five minutes, taking notice that every duct to bearings and every oil hole is open. Then apply lubricating oil. When you are ready to enter the grain with a new machine, raise the machine well up, tilt the platform forward; open the throat of the machine by throwing the butt adjuster forward and start in with about one-half of a full swath. After five minutes work the machine is ready for maximum results. If compelled to make a full swath at the start, cut the grain extra high.

Never change the adjustment of a new binder head before going into the field. It may miss a few bundles at first, but do not adjust. Apply a liberal amount of coal oil to the knoter head and the trouble will usually disappear.

**New Machine Failing to Start.** Occasionally a new machine fails to start due to some part sticking or catching. Throw the binder out of gear and see that the bull wheel revolves without catching. Remove the elevator chain and throw in gear. This will test the sickle. Next put on elevator chain and throw off reel chains. This will test the rollers. Then connect and test the reel. This method

will test one part at a time and should locate the trouble without difficulty. In testing out head for failure to revolve, operate head by hand at back of machine through shaft which drives head from elevator chair.

### General Binder Troubles

**-Chains.** Undue wear in chains may be caused by the chain being run too tight or backwards. Run the chain with the hooks of the links leading and with the openings of the hooks out. The use of oil or grease on chains, if the binder is being run in a sandy country or under dusty conditions, is not to be recommended, for the oil will collect the fine particles of grit and cause excessive wear. Under such conditions use dry graphite. Chain jumping is caused by the chain being too loose or by the sprocket being badly worn. If a worn sprocket is the cause for the trouble a new one will have to be supplied.

**Canvas Troubles.** The creeping of canvases is caused by running them too loose or by the elevators not being square. Test the elevators to see if they are square by means of measuring the diagonals, and then square by the special apparatus to be found for that purpose. Have the canvases of the same tightness on both sides.

Canvases not elevating the grain may be caused by missing slats or loose canvases. Broken slats are generally caused by the elevators not being square, or by the canvases not being buckled evenly and thus the slat is forced to pass over the roller at an angle to it. Chewed slats may be caused by a projecting bolt or the canvas guides being out of shape.

**Heavy Draft.** Heavy draft may be caused from lack of sufficient good lubricating oil, bull wheel being entered in quadrant wrong; chains, especially main drive chain, being too tight; paint or varnish not being cut out of the bearings; or rollers binding. Apply lubricating oil to the bearings.

**FARMERS AND BREEDERS, SHELBY COUNTY**

Enter the bull wheel in the quadrant square. Have the proper tension in the chains. Coal oil will cut the paint or varnish from bearing surfaces. When machine is empty, operator should be able to move elevators by hand on elevator chain.

**Sidedraft.** Sidedraft in a binder refers to such resistance of the platform end of the machine as to cause a "dragging" of platform, and hence results in a tendency to run the machine into the grain. It may be caused by (a) grain wheel bearing too light; (b) grain wheel being out of proper adjustment; (c) sickle parts not cutting properly, resulting in a pulling off of stalks rather than cutting; (d) very light grain may give a condition where sidedraft is more noticeable, and (e) a fast horse on the outside may lead the operator to believe he has sidedraft.

**Remedies.** (a) See that grain wheel revolves freely and perfectly on axle. If axle, bearings and wheel bell are badly worn, replace. (b) The inexperienced operator cannot tell whether a grain wheel is aligned properly or not. It should lead out of the grain slightly, and in case of poor alignment here, an expert must be called. (c) Obvious. (d) Sidedraft here is an advantage rather than an objection for it indicates the best construction. (e) Put fast horse on inside.

If difficulty is experienced in getting far enough into the grain with a tongue truck attachment, make adjustments to increase the angle between the platform and tongue proper, i. e., without changing position of machine make adjustments to let horses away from grain slightly. If machine runs too far into grain, make adjustments to bring horses a little closer to grain line. These adjustments can be found between tongue and stub tongue on the McCormick and Milwaukee binders, and in the truck axle braces on the Deering. If sufficient adjustment is not provided in the Deering to permit a full swath, turn the tongue over.

**Badly Shaped Bundles** in good grain are caused by improper manipulation of binder parts. Set the reel to strike straws about two inches below the heads. Run the butter as near at right angles to the rollers on tier shaft as possible, even if you have to sacrifice an inch or two in

the position of the band on the bundle. Do not expect the butter to shove the straws down under the breast plate. Adjust the position of the head to bring the straws under the breast plate and then adjust the butter to smooth the butt of the bundle. In uneven grain the head, butter and reel must be shifted often to obtain the best results. In very short grain or in down grain leaning toward the elevators we have probably the worst conditions for good bundle making, especially for eight-foot binders. First, do all possible to retard the heads by running the platform as level as possible and place a rope head-retarder across the platform, tying the same to the outside divider frame. A rope head-retarder is often found to give better results than the retarding strap iron sent out with the machine, but if the latter is used, the operator will find that he gets very good results in retarding heads by bending up or crinkling the end of the strap iron. Throw the head as far forward as possible and run the butter as near perpendicular to the rollers as possible to still have the bundle securely tied. Tighten the front grain check.

**Badly Shaped Bundles in Long Tangled Grain** can be remedied by loosening all grain checks slightly and by adjusting the head to tie a smaller, looser bundle.

**Getting Grain Down to Packers.** Trouble is sometimes experienced in getting light, fluffy grain down to the packers. See that the deck roller is working properly and lower the deck cover.

**Choking Down.** Sometimes in heavy, fluffy and tangled grain, and often in flax, the head cannot discharge a bundle and is stopped by "choking." Adjust the head to tie a smaller, looser bundle, loosen all grain checks and loosen the tension on the compressor spring, which is the spring attached to the compressor rod.

**Bundles Too Loose or Too Tight.** Tighten or loosen the trip spring shown in Illustration 1 and described below under "Binder Head Troubles." Do not attempt to make a tight bundle by tightening the twine tension on the twine can. The twine tension is not for the purpose of affecting the

tightness of bundles and if it is used for such purpose serious needle troubles will result. The twine tension should be sufficiently tight to keep back slack in the twine between the can and needle.

**Bundles Too Large or Too Small.** Move the compressor arm nearer or farther away from the needle. The compressor arm is that arm against which the bundle is formed and as it is moved in or out that space in which the bundle is formed is changed.

**Reel Troubles.** Short oats is often the cause for considerable reel trouble, especially reel breakage on those machines which have no outside reel support. The operator cutting short oats will necessarily have to tilt his platform well forward and run his reel low. This means that occasionally the reel slats will whip down onto the guards and result in broken parts. Farmers in some localities have solved this difficulty by tacking on to each reel slat a piece of heavy linoleum about six inches wide. The reel can then be run higher, for this extra piece on the slats serves admirably to force the grain over onto the platform and at the same time is sufficiently flexible to give if the reel is whipped down on the guards.

#### Binder Head Troubles

Before taking up binder head troubles let us refer to the first illustration and get clearly in mind the exact function of the parts mentioned. Every operator is aware that his packer shaft revolves continually and

that at certain moments it must drive the whole binder head while the bundle is being tied and cast. The dog, shown in the illustration, is that mechanism which throws the head in motion with the rest of the machine, or it is that mechanism which momentarily engages the head with the continuous motion of the packers while the bundle is being tied. Sufficient pressure by the straw on the trip arm raises the stop arm, shown in the illustration, which allows the dog to be forced into the path of the continually revolving binder head driver. A little spring attached to the dog forces the dog into the path of this driver when the dog is released, and this same spring holds the dog in this path until the stop arm can drop back into place and force the dog back out of the way of the revolving drivers of the packer shaft. When the dog is thrown back out of the path of the binder head drivers, the motion in the head ceases and the dog, if properly working, must remain engaged with the packer shaft until the discharge arms make a complete revolution. The continuity of motion in the head depends upon the dog.

**Discharge Arms Fail to Start or Fail to Revolve Completely.** This is a dog trouble. See that the dog spring is in place and is of sufficient strength to hold the dog in the path of the binder head drivers when the dog is released. See also that the striking faces of the dog and dog driver are not worn sufficiently to permit them

to slip by one another. If the discharge arms revolve by jerks it is very probable that a worn condition in the striking faces is the cause.

**Discharge Arms Revolve Continually.** Before discussing this trouble a word should be said regarding timing. It will be noticed that every part of the binder head except the packers works at a certain moment in relation to other parts. The dog makes a certain number of revolutions before the stop arm is allowed to drop back into place to throw the dog out of engagement with the binder head drivers. Hence the relation between the stop arm and the dog is a set relation maintained through beveled gears. If for any reason these gears are separated and not put back in the original definite relation to each other, the head is said to be out of time. This means that the stop arm would not be in place at the proper moment to throw the dog out of engagement and a second revolution of the discharge arm immediately follows the first. The timing principle holds true in all makes of heads and is obtained in a way more or less common in all types, though the mechanism will vary to some degree in its shape and position. If the discharge arms revolve continually the head may be out of time or the stop arm face may be so badly worn that it allows the dog to slip by when the two come together. If the machine is out of time, i. e., if the stop arm is not in place to throw the dog out in the proper time, turn the head by properly meshing the beveled gears between the packer shaft and the binder head counter shaft which runs up to drive the tier shaft. If the striking faces between the dog and the stop arm are so worn that they slip by one another, file the faces to their original form. If this allows too much play or looseness in the dog (which can be tested by taking hold of the discharge arms to determine whether they are tight or loose) a new dog or perhaps a new stop arm must be purchased. Some machines permit lengthening of the stop arm. Look for such adjustment and use same to hold the dog back tighter.

**Casting Very Small Bundles.** There are two causes for this trouble. The dog may not be thrown out at the

proper time, and the remedy for such a condition has been just stated above. Small bundles often appear in badly tangled grain when the cast bundle is not cleaned from the machine and its weight trips the head again immediately and a small bundle is cast which seems to be really a part of the first. Manipulate the machine to make a clean bundle, loosen the grain checks, adjust the trip spring to tie a looser bundle and adjust the compressor arm to tie a smaller bundle.

**Discharge Arms Not Set Tight, or Dog Drive Strikes Dog.** Usually these two conditions accompany one another and are due to extreme wear in gears and dog, or tier shaft lock may have become loosened. The tier shaft lock is usually a little dog working behind the tier shaft cam wheel at the end of the tier shaft. It holds the discharge arms in place when they are at rest. Examine your binder head for this mechanism and if it can be adjusted usually the trouble can be remedied by such adjustment. If the cam track in tier shaft cam wheel acts as the lock, new parts may have to be added to relieve badly worn conditions, but this will not necessarily remedy the striking between dog and driver. If head is very badly worn and all gearing has considerable play, the dog may be advanced one cog which will bring the head into better time. Great care must be used in doing this, however, for it often happens that a head so treated will work perfectly when operated by hand, but when driven by the packer shaft under actual conditions the tier shaft is not compelled to complete its revolution and thus is not "driven home" and locked. This will then result in the discharge arms dropping down and in greater interference between dog and driver. It is sometimes found necessary to replace badly worn gears, in order to entirely eliminate this trouble.

#### Knotter Head Troubles

All binders are very similar. They combine the same principles, and although the detail of the mechanism may differ somewhat, still for every vital part on one make of machine there can be found on each other machine a part similar in function, very similar in shape, and often very

similar in position. This is particularly true in the knotter head or that portion of the binder head which ties the knot. In discussing these troubles then, let us bear in mind that every make of binder has in some form each part shown in the second illustration, and that the functions of these parts are the same though the position and shape may vary slightly.

The disc is that part which holds the end of the twine while the bundle is being formed. The bills, also shown in the illustration, are those parts which tie the knot. It is the function of the needle to bring up the needle end of the band, place it over the bills and into the disc where the disc catches it and securely holds both ends. The bills then revolve, forming a loop about themselves, and after revolving part way they open, seize both ends of the band, as shown in the illustration, and hold the ends of the band while the stripper arm pulls

the loop off the bills—hence the ends of the band are pulled through the loop and the knot is tied. If these operations are kept clearly in mind the operator will find his tying troubles greatly simplified.

Each operator should be able to tell just where his trouble lies by examining the failing band and noting where it is found.

In the third illustration, Figure 1 found clinging to the bills with the simple knot tied around the bills and the loose end cut square and smooth, indicates that the disc spring is too loose and the twine tension is too tight.

The same band found cast with the bundle instead of clinging to the bills would indicate that the disc is but slightly loose, yet too loose. The band indicating such trouble is shown in Fig. 2.

Fig. 3 found clinging to the bills but with the free end crushed and

FARMERS AND BREEDERS, SHELBY COUNTY

ragged indicates that the disc is too tight and that the twine tension is also too tight.

Fig. 4 found cast with the bundle instead of on the bills indicates that the twine tension is perfect but that the disc is slightly too tight.

Fig. 5 found with the cast bundle and with both ends crushed and ragged indicates that the disc is very tight.

Notice the bent crinkled ends in Fig. 6 and that the band is formed with the bundle. The ends have been in the knot but have pulled out. The bills may be too loose or the "hump" on the underside of the upper bill may be worn away sufficiently so that the bills cannot hold the ends of the band securely enough when the loop is pulled off. This probably has caused a loose knot which pulled out when the bundle spread. If the bills are too loose tighten the bills spring. If the little "hump" is worn away file away a little of the stock behind the hump, using a rat-tail file.

Fig. 8 is the familiar band which seems to be tied perfectly when the bundle is first cast, but when the shocker grasps the bundle the band gives way and appears as shown. If the disc is at the proper tension, then the trouble is probably that the bills do not open wide enough to grasp both ends of the twine in the disc. If the bills cam roller on the back of the upper bill is worn one-sided; sup-

ply new parts. If the whole bills shaft has dropped down due to wear below the bills pinion gear, place a very thin washer under pinion to bring the bills up against the knitter head frame where they belong. It sometimes happens that a very loose twine tension allows sufficient slack in the twine to arch slightly over the bills instead of being pulled down tightly over them. The upper bill will then nose in between the bands' ends instead of grasping both of them and a simple slip knot is tied instead of a hard knot.

Fig. 9 indicates a needle trouble. For some reason the needle has not placed the twine in the disc. Most likely the needle has carried up some green stuff of some kind which momentarily clogs the disc. If this band occurs frequently, however, then probably the eye of the needle has become so badly worn back, due to too tight a tension, that the needle can not advance far enough to place the twine in the disc. The needle should advance until it just barely touches the stripper or breast plate. If it does not advance that far it is probably slow and the needle pitman should be shortened slightly.

Make all binder head and knitter head adjustments gradually. A quarter of a turn of the studs on the disc and knitter bills springs is ample to remedy most troubles in those parts.

## CORN PLANTER ADJUSTMENTS

By C. O. Reed, University of Illinois in Prairie Farmer.

Not all of our implement troubles are to be found in the plow or in the binder. The corn planter has troubles of its own, and it is the purpose of this article to discuss some of the corn planter principles and troubles that are often misunderstood.

### Accuracy in Drop

Some corn growers say that accuracy of drop is not an important factor with them because two kernels in one hill and four in the next gives an average of three kernels per hill and that is the number desired. The fallacy of this statement is very apparent when we stop to consider that in such planting we have not the desired three kernels in either hill; and if the soil is three-kernel soil, two kernels per hill are too few while four kernels are too many. The result is probably a loss in each hill.

A certain soil may give the best yield with either two, three or four kernels per hill, but after it has been ascertained which number of kernels is best every effort should be made to secure that number in each hill where the soil conditions remain constant. The variable drop devices on planters afford ample opportunity to shift from two to three or from three to four kernels per hill as the soil conditions through the row may demand, but the advisability of permitting inaccuracy in drop from hill to hill is questionable.

The first two requisites for accuracy in drop are (a) seed of uniform size, and (b) the selection of the proper seed plate. Hand tipped and butted corn or machine sorted corn will give seed as uniform in shape and size of kernel as is practical, but unsorted seed may be relied upon to cause inaccurate dropping.

Testing out the planter to make sure that the proper plate is used is to be strongly advocated. Last year's plate may not be the best one for this year's seed, for if there is a slight difference in the average size of kernels between the two years, a corresponding change may be necessary in

the size of the seed pits in the plate used. The following table taken from laboratory tests shows the danger of carelessness in selecting the seed plate. The planter was set to drop three-kernel hills, and the plates "small" and "large" were plates next size smaller and next size larger than the proper or right sized plate found.

	Right	Small sized	Large
		plate	plate
Per cent of blank hill..	9.34	.00	.00
Per cent of hills containing 1 kernel.....	29.36	.26	.28
Per cent of hills containing 2 kernels .....	37.54	8.66	5.3
Per cent of hills containing 3 kernels .....	20.48	88.12	81.28
Per cent of hills containing 4 kernels .....	2.66	2.84	11.48
Per cent of hills containing 5 kernels .....	.62	.12	1.66

These figures tend to show that a slight mistake in plate selection may lead to a direct loss in stand. There may be but a very slight difference between two pairs of plates—so slight perhaps that we can not detect the difference by eye—but a test of the two pairs will quickly show that one of those pairs means a good drop while the other pair is dangerous and its use should be avoided. Testing can be done when time at the barn permits and will not only mean a saving of time in the field but will also enable the operator to avoid a mistake before it is too late.

Each operator will have his own method of testing out the planter but he should heed these three rules: (1) Let each test consist of at least 50 or 60 hills; (2) run the planter parts at field speed; (3) do not give up until the best plate is found. Probably the quickest way to test is to run the planter in the farm yard, providing the chickens do not get the corn before we can count it. Rainy day testing on the barn floor is a little more troublesome but can be very successfully accomplished by two persons as follows: Jack the planter up over a blanket stretched tight on the floor so that the furrow openers will be about three inches above the blanket when

the depth lever is thrown forward. One man can then turn the drive wheel, trip the check arm and call out the number of kernels dropped, while the second person records the count. After each hill is dropped the kernels are brushed away by foot of the man turning the drive wheel. Glancing at the drop without recording the count simplifies the process but it is not an accurate method and should be avoided when possible.

Accuracy of drop may be secured further by keeping the seed hoppers at least half full at all times.

#### Blank Hills at the Ends of Rows

Accuracy of drop depends also to some extent upon the speed of the valves. It sometimes happens that at one end of the row we will happen to stop the team just as the button on the check wire has begun to force the check arm. The valves work so slowly at such a time or stop at such a point that in some planters the seed at the top of the boot drops clear through to the ground instead of being intercepted at the bottom of the boot. Two hills drop at once, then, and when we have turned around there are no kernels at the lower valve ready for the first hill on the return trip. On some planters we may overcome the difficulty by foot dropping one hill while the team is turning. On other planters the only remedy is to stop sooner at the end of the row or to drive ahead at usual speed until the wire has released the check arm.

#### Accuracy in Check

Considerable attention is usually given to securing accurate checking, but a word regarding the adjustment will not be amiss. Accurate checking means possibility of closer cultivation and less loss by cultivating out hills. The manufacturer has found that under usual conditions the check wire will travel from one to three inches across the field, and inasmuch as the slack will always be ahead of the machine, he designs his planter to drop the hill at a distance behind the button equal to one-half the travel. On the return trip the hill is again dropped behind the button and thus the hills should check in spite of the wire travel. It can readily be seen then that if our shoes or furrow openers are dropping nearer to or farther away from the button than half the wire travel, our system for securing good checking will be materially interfered with and adjustments must be made at A in Fig. 1.

This tongue adjustment will vary on the different makes of planters. On some it is at the rear end of the tongue, but it will be found on all the popular makes. As a rule the front frame of the planter should be run level, and it can be so run with a properly drawn check wire. But different tensions on the wire drawn by different drivers may necessitate throwing the front frame slightly out of a horizontal position. If the planter drops too close to the button, make such tongue adjustment as will

Fig. 1. Tongue Adjustment to Secure Accurate Checking

**A****B.**

A Spread Check Fork May Cause Stringing

drop the furrow openers back a little toward the wheels. To some extent tightening the check wire will accomplish the same result in the check. Forcing the furrow openers a little ahead by means of the tongue adjustment will cause the hill to be dropped a little closer to the button, or having the check wire a little more slack will have the same result in the check. In testing for accuracy of check by digging up hills, select hills pretty close behind the planter. Adjusting the neckyoke straps will also affect the check. The adjustment shown in Fig. 1 is also a means of maintaining a good check when different heights of teams are used and when the difference cannot be compensated for by adjusting the neckyoke straps.

Uniform tension in the check wire must be maintained if accurate checking is to result. Some drivers even go so far as to make allowance for the expansion and contraction of the check wire due to varying tempera-

ture from day to day, but this is getting too particular to be practical. It is practical, however, where planting is being done up and down a slope, to pull the wire tighter when setting the high stake.

#### Uniform Depth of Planting

In planting over a rough field, a more uniform depth can often be secured by floating the furrow openers, but when this is done the operator should keep the openers under foot control so that the shoes may be forced to their depth in dry spots and kept from planting too deep in moist, soft spots. There are a number of shoe gauges now on the market which attach to shoes to insure uniform depth when floating is desirable. Such attachments should prove valuable if properly used where the conditions demand. Stringing of the hill may be caused by (a) dirt in the boot, and (b) by a spread check arm. Trouble from the first cause will probably be

due to the team having set back on the planter while the shoes were still in the ground. Clean out the boot bottom thoroughly and the rest of the remedy is obvious. Trouble (b) is less easily detected. If the check arm is spread as is shown at B in Fig. 2, the wire button will let go of the check arm before the valves have been forced wide open, to the result that the kernels will be strung out in the row rather than being dropped well together. By means of a hammer, drive the arm halves together to their original position, but in so doing care must be taken not to get the halves so closely together that binding of the wire will result. The check arm halves can be left straight as shown at A in Fig. 2. Some operators find that stringing is due to a badly worn shoe. If this is determined to be the cause, new parts must usually be supplied.

#### Clutch Troubles

Clutches on the various planters differ so widely in design that no specific rules can be given that would apply to all makes. Failure of the clutch to grip or release can often be overcome by thoroughly cleaning the parts, and if the striking forces are worn round, new parts may have to be secured. On most planters this means but slight expense and a little patience.

#### Timing the Plate Rims

Breakage may necessitate removal of the rim which drives the plate. This rim is timed with the pinion on the shaft which drives the plates from the clutch, and when the rim is replaced on the machine the "time" must be re-established. If the plate rim is out of time with the pinion, inaccuracy will result because the plate itself will not stop at the proper time.

On some machines the cog teeth of the rim and pinion are so marked or constructed that it is very easy to ascertain the proper relation between the two castings. Before removing the rim the operator should carefully seek any such guides so that he may know just how to replace the parts. If no guide is found on the arm and on the shaft pinion, make a mark on each by means of a cold chisel, and then in replacing parts bring these

two marks into the same relation to each other as at first. It sometimes happens that after replacing a rim or adding a new one, it breaks as soon as it revolves. This is due to non-timing.

The question is often asked: "Is the disc furrow opener preferable to the ordinary shoe runner?" The single disc opener has better penetration than the shoe and will cut through trash to better advantage, but it throws the soil to one side and covering is made more difficult. The double disc has less penetrating ability than the single disc, but covering can be more easily accomplished after it.

In hard, trashy ground, then, the disc opener should prove preferable to the shoe opener, but in a well prepared seed bed, well free from surface trash, the shoe is strongly advocated because of its simplicity. The planter with disc openers cannot be considered a heavy draft implement, but the discs carry bearings which must work in soil and one may always expect trouble with such a combination.

Prairie Farmer

## LIVESTOCK FARMER'S MEDICINE CHEST

By Dr. A. S. Alexander in Prairie Farmer.

When a farmer can employ a competent graduate veterinarian at reasonable expense it always is best to do so, and in all serious cases such expert help should be used even if the expense will be considerable. Unfortunately it is not always possible to find such an expert or he may live at such a distance that an ordinary or trivial case will not warrant the expense of his employment, or the nearest veterinarian may not be a properly qualified practitioner, or is one in whom the stockman has no confidence.

For these reasons every owner of animals should keep some simple remedies on hand, and these are necessary even on farms where professional assistance can readily be had. It should be understood, however, that the untrained farmer should not attempt the administration of strong poisons, alkaloids and many preparations used hypodermically by a graduate veterinarian. Such preparations are extremely dangerous in the hands of the layman and are liable to do much more harm than good. The trained surgeon also should be depended upon for all major operations.

A cupboard may be set apart for storing medicines in a cool, dry place and where freezing will not occur in winter. A glass graduate and scales will be necessary for measuring and weighing medicines. Powdered drugs should be kept in tightly closed glass fruit jars and should be plainly labeled. They may soon lose their strength if exposed to the air. Poisons should be kept on a separate part of a shelf partitioned off for the purpose and away from simple, harmless drugs. Ointments, with the exception of fly blister, should be made up fresh at time of use. Liniment may be prepared and kept indefinitely if well corked.

The medicine case should also have a special division in which to keep a few instruments, bandages, suture silk

and absorbent cotton; or better still, these may be kept in a handbag for immediate use as required. The emergency bag should contain a roll of absorbent cotton, several rolled three-yard bandages of unbleached muslin in strips three inches wide, a pound or two of oakum, a spool of strong suture silk, half a dozen suture needles of assorted shapes and sizes, most of them large; a half-ounce, short-barreled, strong-nozzled hard rubber syringe, a two-ounce metal syringe, a cow trocar and canula for tapping a bloated animal, a pair of curved shears, a combination operating knife containing a curved bistoury, a probe pointed bistoury and a strong straight scalpel, a few milking tubes and a teat bistoury, an artery forceps, metal probe, castrating knife and pair of horse clippers.

These will suffice, but there are many other useful instruments such as a clinical thermometer, horse trocar, catheter and dentistry "float," which may be added from time to time. Some of the medicines to be listed later may also have a place in the emergency kit or bag, notably those needed for the treatment of wounds, and at hand should be a strong quart drenching bottle and ten feet of quarter-inch cotton rope with which to hold up a horse's head for drenching. A veterinary force pump is added on a large farm, but its place may be taken by three feet of new lawn sprinkling hose fitted with a large tin funnel. This is used to give a horse or cow a rectal injection. There should also be a six-foot piece of new half-inch rubber tubing for use in giving a cow or mare a vaginal injection.

Simple necessary medicines may best be listed under the following special heads:

### Physics.

Epsom and Glauber Salts. Average dose for an adult cow, one pound in

three pints of warm water. Dose for a horse, 12 ounces.

**Castor Oil.** Especially useful for young animals. Dose for a calf or foal, from 1 to 6 tablespoonfuls shaken up in milk.

**Raw Linseed Oil** (not boiled, which is poisonous). Average dose, one pint for constipation and to follow a dose of colic medicine, or contain medicine for colic.

**Barbados Aloes** (freshly powdered). Average dose, one ounce, to be given to an adult horse as a "physic ball."

#### Wound Medicines.

Keep in stock one pint each of carbolic acid and coal tar disinfectant and a gallon can of the latter for dipping and disinfecting purposes. Two teaspoonfuls to a pint of water ordinarily makes a sufficiently strong solution. Bleeding is stopped by applying Monsel's solution of iron on oakum or cotton batting, or applying Monsel's powder. As a wound lotion also keep on hand a mixture of one ounce of sugar of lead and six drams of sulphate of zinc in one pint of water. This is called "white lotion" and should be plainly labeled "poison" and well shaken before use.

#### Dusting Powders.

A dusting powder of equal parts of slackened lime, charcoal and sulphur is useful for application to surface wounds and sores. Boracic acid also is needed and a little iodoform may be added to keep flies away.

#### Liniments.

Keep on hand a pint (pound) each of turpentine and aqua ammonia. One ounce each of these mixed with a pint of soft water, in which two raw eggs have been shaken up and the mixture left for 24 hours, will make a good stimulating liniment; or one ounce of each may be mixed with 6 to 14 ounces of raw linseed oil to make a very strong or comparatively mild liniment.

#### Lotions.

"White lotion" for wounds has already been mentioned. Equal quantities of lime water and raw linseed oil make "carron oil," an excellent lotion for burns. Two to four ounces of Goulard's extract and one to two ounces of glycerine in one quart of

soft water form a useful lotion for scratches and mud fever of itchiness and "gumminess" of the legs. A good lotion for inflammation of the udder is made by mixing together one part each of fluid extracts of poke root and belladonna leaves and one part of turpentine with five parts of sweet oil, melted lard or camphorated oil. It is made weaker or stronger as required. Anodyne lotion for painful swellings is made by combining equal quantities of tinctures of opium, aconite, belladonna and druggists' soap liniment. A small quantity of chloroform may be added. Mouth lotion consists of an ounce of powdered borax or alum in a quart of soft water; eye lotion of half a dram each of sulphate of zinc and fluid extract of belladonna in a quart of soft water.

#### Tonics.

Fowler's solution of arsenic is a good general tonic for rundown, thin, hidebound horses and those afflicted with chronic skin diseases or heaves (broken wind). The average dose is half an ounce (one tablespoonful) given night and morning until one quart has been given. The medicine may then be gradually discontinued, taking at least a week to the work. Dried sulphate of iron (copperas), dose one dram night and morning, is another good tonic, commonly combined with an equal dose of ground gentian root or ginger root, nux vomica, saltpeter and fenugreek as a condition powder. The dose is one tablespoonful of the combination of drugs mixed in the feed night and morning for ten days. Omit sulphate of iron for pregnant animals. Nux is poisonous and must therefore be given with care. It is most useful as a nerve tonic and appetizer.

#### Colic Medicines.

Keep in stock one pound each of laudanum (dose, 1 to 2 ounces); essence of ginger root (dose, 1 to 2 drams); sulphuric acid (dose,  $\frac{1}{2}$  to 1 ounce); turpentine (dose, 1 to 2 ounces); granular hpyosulphite of soda (dose, 1 to 4 ounces). A dose of each of the first three medicines in a pint of water containing two ounces of hpyosulphite of soda will prove effective for most colics. Two ounces of turpentine in a pint of raw linseed oil may be given for "wind" (flatulent)

colic, or following the other medicine when the pain of "cramp" (spasmodic) colic has subsided.

#### Fever Medicines.

Powdered saltpeter is an important drug for animals. It is given in the fever of influenza, founder (laminitis) or lymphangitis (milk leg, also for stocking of the legs and other large swellings). A dram is the average dose. Give it every four or six hours in fever, twice daily for swellings, or with tonics as a condition powder, and in double doses for founder or milk leg. Do not give it in colt distemper, when abscesses are forming. It may often be administered in drinking water or a bran mash or damp feed. It also is given in tablespoonful doses once or twice daily for garget of the cow. Beware of aconite often given for fever. It is too dangerous a poison to be safely used by anyone other than a trained doctor.

#### Blister.

An effective blistering ointment is made by melting together three parts of lard and one-quarter part of finely shaved yellow beeswax, and then stirring in one part of powdered cantharides (Spanish fly). Stir in a tin dish until cold, then store in a capped glass fruit jar. It improves with age. When using this blister clip off the hair, wash the skin clean, dry it perfectly. Tie the horse up short in his stall, rub the blister in for fifteen minutes and then smear on some more blister. Wash the blister off in 48 hours and then apply a little lard daily. Do not cover a blistered part, or rub it on the loins, or on top of the hips, or use it after a poultice, or on irritated skin, or in very hot or cold weather.

#### Absorbents.

Never be without tincture of iodine to swab on swollen glands, tumors, forming abscesses, bony growths, capped or puffed joints, indolent sores or wounds, canker of the mouth in pigs and ringworm spots. It also is useful to inject into abscesses, fistula and lump jaw cavities. Iodine ointment is made by mixing one dram each of iodine crystals and iodide of potash in one ounce of lard. This is used on swellings, sore necks and shoulders, puffs of all sorts, tumors,

forming abscesses, ringworm spots and enlargements of the udder. As an absorbent blister rub up one dram of biniodide of mercury with two ounces of the fly blister already mentioned and use on bony growths, such as splints and ringbone, callouses, indolent sores, tumors of the udder.

#### Worm Medicines.

Gasoline is kept on most farms and in tablespoonful doses in six ounces of milk is the best remedy for stomach worms in sheep. Lambs take less in proportion. Two ounces of turpentine in a pint of raw linseed oil is effective as a starting dose for a "wormy horse." Follow with worm powders composed of equal parts of salt, sulphur and dried sulphate of iron. Dose, one tablespoonful night and morning for a week, then skip ten days and repeat. Omit iron for pregnant animals. For worms of swine give one teaspoonful of turpentine in slop for three consecutive days for each eighty pounds of body weight; or one dram of dried sulphate of iron in slop for five successive mornings for each hundred pounds of body weight. Where swine are known to be seriously infested with worms, give eight grains of santonin and five grains of calomel in a little slop for each hundred pounds of body weight. Divide the pigs into lots of five and give the medicine in a little slop after starving the animals for eighteen hours. Care must be taken to give only the doses here prescribed, else damage may be done.

#### Disinfectants.

In the paragraph on wound medicines it has been advised to keep carbolic acid and coal tar disinfectant in stock. To these may be added formaldehyde, bichloride of mercury tablets and permanganate of potash crystals. In disinfecting a stable a solution of four or five ounces of formaldehyde to the gallon, or a 1-1,000 of bichloride of mercury (corrosive sublimate) or a 1-30 solution of carbolic acid or coal tar disinfectant should be used after a thorough cleansing of the premises. For wounds a 1-1,000 solution of corrosive sublimate also is the most effective disinfectant and a 1-500 solution should be used for disinfecting when a spore-forming germ, like that of anthrax, is pres-

ent. Permanganate of potash is a useful mild disinfectant (antiseptic and deodorizer) in a 1-5,000 to a 1-50 solution. The weaker solution is used lukewarm for vaginal injection purposes, while the 2 per cent solution is useful for injection into cavities from which come bad-smelling discharges and for swabbing sores (cankers) of the mouth. As a wound lotion it is usual to employ a 2 to 5 per cent solution of carbolic acid, or lysol, or coal tar disinfectant. Carbolic acid is also much used as an internal disinfectant in contagious abortion. Two drams of the acid is well diluted with water and mixed in soft feed for each pregnant cow every other night throughout pregnancy. Peroxide of hydrogen one part and clean water two or three parts is a popular disinfectant for cleansing foul wounds.

### Scour Medicines.

The farm medicine chest would not be completely stocked without some remedies for diarrhoea or scours. A mixture of one part of salol and two parts of bismuth (first prescribed years ago by the writer) has become a standard remedy among farmers. The average dose is one teaspoonful given two or three times a day and washed down with milk or water. The dose may be doubled in bad cases and for larger calves and foals. Prepared chalk, powdered alum, sulphur, powdered catechu, rhubarb and ginger root are also much used for diarrhoea.

### Administering Medicines.

Small doses of liquid medicine, such as the average two-ounce dose of a fever medicine or tonic solution, are best given by means of a half-ounce hard rubber syringe. Expert veterinarians sometimes give such medicines or bad-tasting drugs in gelatine capsules, or in form of a "ball." Worm, condition and tonic powders are mixed in damp grain feed. A large dose of liquid medicine is termed a "drench" and is given from a strong, long-necked bottle. A few inches of rubber hose may be fitted on the neck of such a bottle.

To drench a horse, back him into a stall, place a running noose of soft, small cotton rope or "clothes line" upon the upper incisor teeth, under the upper lip, and draw the noose tight, with the knot of the rope to

the front. Throw the loose end of the rope across an overhead beam, raise the horse's head, hold it there by means of the rope and pour the medicine into the mouth a little at a time until all is swallowed. Do not squeeze the throat of the horse when giving medicine and never pour the medicine into the nostril. If the horse will not swallow, pour a teaspoonful of cold water into a nostril and swallowing will instantly occur.

To drench a cow, place her in a stanchion or tie her in a stall. Walk up on her right side (milking side). Pass the left hand across her face and into her mouth. Hold her head in a straight line forward and slightly elevated, not turned to one side. Pour the medicine very slowly into the right side of the mouth. Let the head down instantly if the medicine causes the cow (or horse) to cough. Fluid given too fast passes into the paunch and is practically wasted. Administered slowly, it largely goes to the third and fourth stomachs and absorption takes place in the latter.

Sheep have to be very carefully drenched from a bottle to avoid choking. Swine take medicine through a hole cut in the toe of an old shoe thrust into the mouth or from a short, strong rubber hose fitted in the neck of a strong bottle. Dogs take medicine in capsules inserted in meat or from a bottle or spoon emptied into a pouch formed of the lip and cheek.

Avoid "doping" animals unnecessarily. Medicine should only be given when the animal is sick, should be the right medicine, and is best prescribed by an expert.

## VALUE OF LABOR

---

The United States Department of Agriculture found in 1855 that it required four hours and 34 minutes of human labor to produce a bushel of corn. At the Minnesota experiment station it has been found recently that 45 minutes of human labor is about the average time required for the same work. In other words, human labor is worth six times as much as it was 60 years ago, due to the use of better machinery, better varieties of corn and better soil management.

## SOME COMMON UNSOUNDNESSES

By Dr. A. S. Alexander, in Prairie Farmer

**T**AKE nothing for granted when buying a horse. One should make sure about doubtful things. If the eye cannot decide the matter the hand may be employed to corroborate or disprove; but the eye should be the main dependence and the hand used only as a last resort. An Irishman does not like to buy a pig "in a poke." He wants to see and examine the "rent payer" and may even make the animal squeal to be sure that he is getting his money's worth. In just the same way one must make the most careful examination of every part of a horse, "size up" the entire combination of points and make sure that there is lack of vice, soundness of eyes, wind and limb, and perfect fitness for the special kind of work the animal will have to do.

A famous veterinary teacher once called upon his senior students to examine a lame horse and state in writing what they thought was the cause of lameness. The horse had a splint,

one sidebone and a small ringbone affecting the lame leg. To one or other of these three unsoundnesses each student in turn attributed the lameness. But one learns best by making mistakes and this truth was soon "rubbed in" by the teacher. Having collected the reports he told the smith who was standing by, to remove the shoe from the lame foot. Then a majority of the students noticed for the first time that the sole of the foot was covered with a thick leather pad. When the leather came off pus spurted from a nail prick wound which had been purposely hidden. Lameness was due to the nail prick, not to splint, ringbone or sidebone, and the laugh was on the "boys." Never again would one of them be similarly caught and so a never - to - be - forgotten lesson was learned. Every intending purchaser should learn this lesson, too, and be a "doubting Thomas" until his hands have felt where the eyes could not definitely decide a mooted point.

Splint

Curb

Seek to deal with men of known integrity in business. If not expert, and the horse to be bought is a dear one, it will be good policy to employ a veterinarian to make a critical examination. Better visit the stable when not expected and see the horse in the stall. There some things can be learned that will not be seen when the horse is warmed up. You should be able to enter and leave the stall on the left side of the horse, without being received with a bite or expelled with a kick. Note, too, if the horse digs a hole in the floor by pawing, or chews his manger and hay rack, which may indicate cribbing and wind sucking, or weaves from side to side, or pulls back on the halter. Make him "stand over" and note if he jerks up a hind leg, or hops over. The hopping may indicate spavin lameness, which quickly disappears when the horse is warmed up.

The jerking up of a hind leg may be accompanied by quivering of muscles and tail and such a horse is a "shiverer" or "crampy" and afflicted with incurable St. Vitus' dance. The symptoms of the latter disease become more apparent as the horse backs out of the stall, but quickly subside with slight exercise. If the animal has "string halt" the jerking up of the hind legs is continued as long as the horse is in motion, he does not warm out of it. When a horse is brought out for inspection "on a run" or "dead jump" it is impossible to detect spavin lameness or chorea and even string halt may not be noticed. This will be more certainly the case if the horse is turned loose in deep snow, or plowed land, or in a straw bedded paddock. This commonly is done. Sometimes an old plug that has scarcely animation enough to get out of its own way will kick up, strut and trot, proud as a peacock, when suddenly the halter shank, previously cut part way through, breaks and the old pilgrim imagines he has broken loose by his own great strength. This trick is often tried. Never allow the dealer to keep the horse "in the air."

After making an examination in the stall watch the horse for a while as he stands at ease on a level floor. Maybe he cannot stand at ease. If a foot hurts, soon that foot will be thrust forward; if two hurt each will

be advanced turn about; if four hurt the horse will rest each foot in turn. And do not forget to walk around the horse that every part may meet the eye. Often one side is a pretty picture, the other marred. See both sides, for often the animal is turned toward the wall if an eye is out, a big bare spot present or some unsoundness there that had best be kept hidden. A "watch" or "wall" eye can see, but it is unsightly. The tour of inspection around the horse discloses all such blemishes.

Remember about not buying a pig in a poke, so remove the blanket from all fancy harness and see that the halter has no springs and trusses to press down upon the nostrils to prevent high blowing and "roaring." Many a man has neglected to remove a horse's hood before buying and afterward has discovered that it hid a cropped, lopped, or split ear, fistula of the base of the ear, a "poll evil" or some unsightly blemish.

Don't get too close to the horse when making the preliminary examination. Ex-Governor Hoard, of Wisconsin, once said that in farm business matters a man may hold a cent piece so close to his eye that it keeps him from seeing a big silver dollar a little further off. So if one rushes up and grabs a foot, before viewing what the French term the *tout ensemble*—the assemblage of all points—he misses the comprehensive estimate of the horse as a whole and that is of most importance. When one has looked the horse over from a little distance and from all points of view and has seen how the animal stands and behaves it will be time enough to scrutinize each component part of his anatomy. First we shall see him move away and back, at a walk, then at a trot, and finally we shall gallop him. Be there when he stops and so decide as to the soundness of his "wind." It is not enough to test the "wind" by standing the horse close to a wall and suddenly threatening to strike him with a whip. The sudden fright may cause the animal to grunt loudly, but this does not necessarily prove that such a "bull" is unsound in wind.

Many sound horses grunt when so threatened, or even when one goes to mount. In the latter instances it is a nervous "expression" and nothing

Sidebone

Spavin

serious. When watching the horse at rest one should note that he does not heave at the flanks, cough or pass gas from the rectum. These are the symptoms of "heaves"; but the "heavy" horse may be "shut" or "doped" with drugs so that temporarily the symptoms do not show. Usually they will quickly appear if the horse is given all the hay and water he wants and then is galloped. Roaring sometimes is temporarily relieved by plugging the nostrils with a sponge or squeezed half lemon. Discharge is also prevented by this means. It is best to locate these at once than have them sneezed into the feed box when the horse is yours.

At both walk and trot the horse should go straight, level and true, each joint perfectly fixed, the soles of the feet well turned up, as he goes away, and no "padding," "winging," in or out, "forging," stumbling or toe dragging noticeable. Lameness should be absent. If the horse passes muster when in motion and his style, action and conformation are suitable, he next may be critically examined as he stands at rest. He should stand square and firm on each foot. The profile of the front and back of each leg should show no abnormal bends, curves, puffs, swellings, or lumps. If any one of these things is seen its nature will have to be carefully determined. • The eyes should be sound and of the same color. The pupils should

dilate in the dark and contract when the horse is brought into the light. Angular, wrinkled eyebrows and sunken eyes denote previous attacks of "moon blindness" (periodic ophthalmia). "Smoky" or "opaque," or "pearl grey," or "curdy" appearance of the cornea (anterior chamber of the eye) denote more serious stages of the disease or blindness from cataract or glaucoma. A brilliant sparkling prominent eye (glassy eye") may be stone blind from paralysis of the retina and optic nerve. The ears should neither be absolutely unused, nor abnormally active. The former may indicate deafness; the latter, impaired vision, nervousness or vice.

See that a thread from ear to ear under the forelock; does not keep lop ears upright and that a leaden ball, suspended from a thread in the ear, is not preventing undue motion. The horse should let one handle his ears, his poll (back of ears), the top of the neck, where the color will bear, and the withers, where fistulous openings or their scars so commonly are found. Fighting against such handling indicates a reason for fear and the reason usually is that a twitch has been used on the ear and the horse may be hard to shoe, have sore neck from the collar, poll evil or fistulous withers, or have suffered a previous operation for such disease.

Handle each part upon which harness will have to bear and see that

It is sound and free from sores, tumors or abscesses. The nostrils should be large, under command of the will, rosy pink inside, not slit and free from abnormal discharge. See that the breath does not smell foul and that the teeth are sound and the jaws not under or over "short." Examine the back. It should be strong, broad, straight, free from sores and well muscled. Pinching the loins is unnecessary. A ticklish horse will squat when so handled but the test does not detect weak kidneys. Note that the ribs are well sprung, the underline fairly straight, the abdomen capacious, the flank not tucked up and the coupling short and strong. See that no wounds or abscesses are present high up on the right flank, as the result of tapping for flatulant colic. With the left hand on the horse's loin, as a support, stoop and examine sheath, or udder as the case may be, and other parts high up in the groins.

Examine the tail, which should be strong, not artificial ("joined on") and not rubbed bare from itchiness. Lift it and see that the black skin below is free from tumors, the anus clean, well pursed up, free from scurvy substances or streaks of mucous; or, in the mare, that the space between rectum and vulva is intact and that no discharge comes from the latter. Looking from the rear, compare one hip with the other. If one is "knocked down" that side will be steep. At each side of the tail is the tuberosity of the ischium. Like the point of the hip (ilium) this often is fractured, leaving one side depressed. All parts of the shoulders, neck, barrel and hindquarters should be smoothly and deeply covered with sound muscles.

Now examine each hoof. Cracks, rings, ridges and meatiness should be absent, frogs and bars prominent, soles slightly concave, heels wide, coronets (hoof heads) open and strong, hoofs waxy, smooth and ample in size. Object to a horse that has steep narrow heels with a deep cleft in frog, also one that has chronic corns, chronic thrush, "dropped" (convex) soles, or hoof walls showing toe or quarter cracks.

Make sure that the elbows are free from hard or soft tumors or abscesses called "shoe boils" and that the knees

are free from hairless scars and are straight, wide, deep and strong. All joints should be large, clean, bony and strong. This is of the greatest importance. The joints cannot be too large so long as the size is made up of large, clean, sound bones, ligaments and tendons. Beware of puffs, meatiness and bony growths which give the wrong sort of size. The knees should have perfect flexion, no matter what work the horse has to do. They should not be bent forward (buck knees) nor bent backward (calf knees). Splints close to the knee are serious; but low down, on an adult horse, they are practically harmless, unless struck by a shoe. Splints, ringbones and spavins are bony excrescences. Splints come on the cannon bones, along the course of the splint bones (small metacarpals and metatarsals).

Ringbones are found high, medium or low, on the long pastern, and often involve the short pasterns. Bone spavins are found at the lower, front, inner aspect of the hock joints. Bog spavins are soft bursal distensions of the hock joints, above and in front of the seat of bone spavins. Thoropins are bursal distensions seen at the sides of the hocks, towards the rear and when pressed on one side bulge out on the opposite side. "Wind galls" are similar puffs in connection with the tendons at and just above the fetlock joints. A curb appears as a hard enlargement giving a rounded bulging contour to the profile of the back of the hock joint, looking from the side.

Splints are most easily seen by standing in front of the horse, then examining further by feeling the parts involved, first with the foot standing down firm, then with it off the ground. Ringbones are best seen from a side view of the profile of the long pastern. The hand may have to help in their detection. To examine for spavins look between the forelegs at the inner, lower profile of each hock. The hard "knob" on one hock probably will prove to be a bone spavin. A small spavin is called a "jack" and it is apt to prove serious and grow to be a large spavin. Spavin may also be detected from a quartering view of the hock, or from the rear.

### CARE OF HORSES

From Prairie Farmer.

Here are a few rules prepared by the Boston Work Horse Relief Association that may as well be observed on the farm as in the city:

Load lightly, and drive slowly.

Stop in the shade if possible.

Water your horse as often as possible. So long as a horse is working, water in small quantities will not hurt him. But let him drink only a few swallows if he is going to stand still. Do not fail to water him at night after he has eaten his hay.

When he comes in after work, sponge off the harness marks and sweat, his eyes, his nose, and mouth, and the dock. Wash his feet, but not his legs.

If the thermometer is 75 degrees or higher, wipe him all over with a damp sponge. Use vinegar water if possible. Do not turn the hose on him.

Saturday night, give a bran mash, lukewarm; and add a tablespoonful of saltpeter.

If the horse is overcome by heat, get him into the shade, remove harness and bridle, wash out his mouth, sponge him all over, shower his legs, and give him two ounces of aromatic spirits of ammonia, or two ounces of sweet spirits of nitre, in a pint of water; or give him a pint of coffee, warm. Cool his head at once, using cold water, or, if necessary, chopped ice, wrapped in a cloth.

If the horse is off his feed, try him with two quarts of oats mixed with bran and a little water, and add a little salt or sugar. Or give him oatmeal gruel or barley water to drink.

Watch your horse. If he stops sweating suddenly, or if he breathes short and quick, or if his ears droop, or if he stands with his legs braced sideways, he is in danger of a heat or sun stroke and needs attention at once.

If it is so hot that the horse sweats in the stable at night, tie him outside, with bedding under him. Unless he cools off during the night, he cannot well stand the next day's heat.

### SOLDERING

By P. O. Barnfield, in Prairie Farmer.

Soldering is so simple and is useful in so many different ways that one naturally supposes every farmer would have a soldering outfit if he thought he could use it to advantage. On this supposition I beg to offer some suggestions which have come from actual experience.

No special ability or experience is required. It is, of course, true that deftness and accuracy naturally follow experience, but good results will as surely follow if one will keep the following points in mind.

The soldering outfit consists of a soldering copper (good size, not under two pounds), a bar of half and half solder, a piece of sal ammoniac, and a small bottle of muriatic acid with a small brush for applying.

Heat the soldering copper not red hot but about the same as a flat iron would be heated for ironing clothes, wipe off the dust on a rag, take a file and rub the surface at the point till copper is clean and bright, then press the hot copper down the sal ammoniac till it makes a depression. Place the end of the bar of solder in this depression and with the copper melt off two or three drops of solder. Remove the bar and rub the copper hard into the depression, but not so as to push the solder out over the edge. Keep this up till the copper is well coated with a smooth bright coat resembling tin. You are now ready for business. Remove every particle of dirt from the parts intended to be soldered. Usually it is necessary to scrape the surface with a knife or file if greasy or very dirty, and then with a small brush apply the muriatic acid. Rub the surface with the brush to remove particles. Now rub surface to be soldered with the hot copper, using solder as desired. If the solder stands in globules and does not spread over the surface it is because there is some foreign matter between the solder and the surface and the cleaning process should be repeated with more care.

Solder will stick to almost any kind of metal if there is no foreign matter on the surface. Since the parts of a

copper under the tinned surface are easily melted, it should never be heated to a red heat.

In mending granitewear or copper, a copper harness rivet or a tinner's t may be inserted after cleaning surface around the hole. Get the

boys started to making measures and buckets, funnels and flue caps. Ask that these be made a specific size and see how quickly they will grapple with problems in mensuration. It also might keep them out of town some evenings.

## HOW TO JUDGE TRACTOR HORSEPOWER

From Prairie Farmer.

early everyone knows the definition of a "horsepower" as given in school arithmetics, etc., namely, "the power required to raise a weight of 33,000 pounds to a height of 1 foot in one minute." As this is a definite, fixed unit of power, one would naturally suppose that the horsepower ratings of two tractors would be a logical and reliable means of comparing their ability to perform work; that a tractor rated at 30 horsepower on the drawbar would be twice as powerful and capable of doing twice as much work as one rated at 15 horsepower on the drawbar, for example. This supposition would be correct but for the fact that there has been no definite standard used in ascertaining the horsepower developed by tractors and the percentage of the power actually developed which should be taken for their catalogue rating. The various manufacturers have followed their own judgment in the matter, and as a result several methods of rating are being used, with a consequent lack of uniformity.

It is because of this fact that at the present time it is quite common to find two tractors doing practically the same amount of work and clearly of about equal power although with widely different catalog ratings. It is obvious that either the outfit with a low catalog rating has been underrated by its manufacturer or that the second machine has been overrated, or perhaps both have occurred. It would seem advisable, therefore, that steps be taken to bring about a standard rule for ascertaining and designating the horsepower of tractors. It is not so important, perhaps, what particular method is followed so long as the same method is used by all manufacturers, thus avoiding having machines of the same power given such varying ratings.

A movement is already on foot in the department to bring about the adoption of some standard. Until one has been decided upon and adopted, it is suggested that farmers, in comparing different makes of tractors, should give particular attention to the number of plows pulled and the amount of work done by the various machines, and that less attention be paid to the catalog ratings.

When outfits can be seen working side by side, as at the tractor demonstrations which are being held throughout the country, the amount of work done is of more value in comparing the relative power than are the manufacturers' ratings, unless exactly the same method has been used in each case.

It is obvious that two tractors—each pulling the same number of plows of equal size, at equal depth, in the same soil, and each moving at the same speed—are exerting practically equal amounts of power on the drawbar. In such case, if each is pulling its normal load, they should have the same drawbar rating. It is not at all uncommon, however, as previously stated, to find tractors under such conditions with widely different ratings. By using as a standard the amount of work done by different tractors therefore a very fair comparison of the drawbar horsepower can be obtained. With this known, a good idea of the power of the motor can be gained. If in the case just mentioned, one of the machines was considerably heavier than the other, it is apparent that it would require more power to move its own weight and that it would therefore not be capable of exerting on the drawbar as large a percentage of the motor's total power as would the other machine, assuming that the loss of power through gears, etc., in the transmission was the same. It naturally follows that the motor on the

heaviest machine would develop more power on the belt than would the one on the lighter outfit.

The terms "brake" or "belt" horsepower mean exactly the same thing and are used to denote the amount of power which the engine will develop and transmit to a belt for stationary work, such as threshing. This amount of power may be computed by different formulas or may be ascertained definitely by actual measurement with a proper apparatus. This accounts for some of the lack of uniformity in ratings. Some companies carefully measure the amount of power developed by each engine before it leaves the factory and then give their engine a catalogue rating equivalent to its maximum power output; others will deduct a certain amount from the maximum horsepower as ascertained and rate their engine at various percentages of this figure in order to be on the safe side, and to underrate their outfit rather than overrate it, while some companies do not measure the amount of power the engine actually develops, but compute it. With the diameter of cylinder, the length of stroke, and the number of revolutions per minute known, the horsepower which will be developed by an engine can be computed with a fair degree of accuracy, although there are a number of formulas used, several of which give somewhat different results.

In comparing the power of two tractors the speed at which they are moving must always be considered. A tractor pulling two plows at 2 miles an hour will do the same amount of work as one pulling one plow and traveling at 4 miles an hour, other conditions being equal, and the horsepower developed at the drawbar is the same, because the element of time enters into the determination of horsepower. The slower any given tractor is geared to move the greater will be the load which it can pull at the drawbar, as it pulls it less rapidly. The amount of work done and the total amount of power exerted will remain practically the same.

It is obvious that in the case mentioned the tractor pulling one plow and running twice as fast as the one pulling two plows must move its own weight over the ground twice as many times as will the other tractor. If the

weight of the two tractors is the same, it will be seen that twice as much power has been expended in moving the weight of the high-speed tractor as has been used by the one with low speed.

A great many farmers find it difficult to understand why a tractor of, say, 10 horsepower at the drawbar will not pull as heavy a load as will 10 horses. This is not because a mechanical horsepower is less than the amount of power developed by a horse, but is because of the fact that a horse has an enormous overload capacity—that is, he is capable of exerting for a short time a great deal stronger pull than he should normally maintain hour after hour.

A tractor, however, has very little overload capacity when pulling its normal load. Thus, if a tractor with a drawbar rating of 10 horsepower pulling its normal load of plows under average conditions should strike a particularly hard spot where the draft was doubled for a few minutes it would stall; while 10 horses under similar conditions could readily increase their pull sufficiently to meet the increased draft.

From this it will be seen that in cases where the draft will vary (and this occurs in practically all kinds of farm work because of grades, soil variation, etc.) the load which a tractor will handle satisfactorily is that which it can pull up the steepest grade or through the toughest soil in the field. This load may be only half of what it can pull under more favorable conditions in the same field. It will also be apparent that the working load of a tractor under ordinary farm conditions is considerably less than the normal load for its drawbar equivalent in horses, that is, a tractor of 10 horsepower on the drawbar will not pull, except under constantly favorable conditions, the load which a 10-horse team would normally pull. The difference might be said to be entirely in the overload capacity of these two prime movers. With a tractor its maximum power is practically its normal power because it is capable of pulling this load continuously, but cannot carry anything in excess of this. On the other hand, the horse's normal load is much less than what he can do in an emergency.

## LIGHTNING RODS PROTECT BUILDINGS

From Prairie Farmer.

"It is generally agreed now that lightning rods, properly installed, do afford a considerable measure of protection to farm buildings, a fact which is indicated by the more favorable insurance rates which many insurance companies offer in insuring farm buildings that are properly rodded," says K. J. T. Ekblaw of the department of farm mechanics, University of Illinois.

"One insurance company of Michigan states that the small sum of \$32 has been paid in four years for damage done to rodded buildings by lightning, although a total risk of fifty-five million dollars was taken. Another company taking risks amounting to fifty-nine million dollars, in the same period of time on both rodded and unrodded buildings, paid for damage done by lightning more than a thousand times as much as the other company paid on wired buildings. A prominent fire insurance adjuster states that in his experience, for every dollar's worth of damage done to properly rodded buildings, there was \$1,168 damage done to unrodded ones. In other words, there was indicated on efficiency of 99.9 per cent in favor of wired ones.

"Some of the points to be kept in mind in installing a system of lightning rod protection are as follows:

"(1) Either copper or galvanized iron may be used for lightning conductors. The cable form is satisfactory and the weight of the copper should be at least three ounces per foot, while that of the galvanized iron should be twice as much.

"(2) All parts of the wiring should be connected up into one system. No blind ends or stubs should be left ungrounded. Joints should be made very securely and the contact made as perfect as possible by soldering and brazing.

"(3) The conductor should be firmly fastened to the building instead of being insulated from it, as is sometimes done. The purpose of the conductor is to take the lightning charge away from the building; insulation prevents this.

"(4) The conductors should follow ridges and sharp corners in the buildings. No sharp turns in the conductor itself should be made.

"(5) Aerial terminals should be located at the ends of ridges and on the ridges at intervals not to exceed 20 feet. Any terminal point on the roof should have an aerial terminal of its own. The aerial terminals should be at least two feet high, firmly braced in upright position, securely fastened to the main cable, and provided with a galvanized or nickled wrought iron point.

"(6) Good earth connections are absolutely necessary. Commonly accepted forms consist of a metal plate buried below the level of permanent moisture, into the soil to a depth of eight or ten feet, securely fastened to the conductor itself.

"(7) All metal masses, such as metal roofs, radiators, hay fork tracks, etc., should be connected to the main system.

"(8) Use good materials, install them properly, and no fear of lightning need be felt."

---

## WHEN THE BELT SLIPS

From Prairie Farmer.

The slipping of belts is a great annoyance, but it is not always remedied by tightening the belt. Ordinarily, if the proper-sized belts and pulleys are used and properly put in, there should be little or no slipping at all. Often the slipping of a belt is due to the overload carried by it. There is economy in using wider belts than is the usual practice. Many a three-inch belt is made to do the work of a four-inch belt, much to the annoyance of the operator and the ruin of the belt.

However, when an immediate remedy is needed, a small quantity of powdered whiting, sprinkled on the inside of the belt, is very good and is the least harmful of any similar application.

The use of beeswax, rubbed on the inside of the belt or on the pulley is a very good remedy in cases of emergency.

Many people use powdered rosin on a slipping belt but this is bad practice because it soon dries the leather and causes it to crack.

Methodist Church, Moweaqua, Ill.

Its satisfactory performance is backed by the makers' Ironclad Guarantee and by testimony of Caloric users in Shelby County.

## Be Sure That YOUR Home is Cozy This Winter

No other heating system can possibly yield so much comfort at so great a saving as the famous

Heats buildings up to eighteen rooms through only one register. Circulates a uniform, healthful warmth throughout the house in the severest weather, while conserving 35 to 50 per cent in fuel. Can be installed in old as well as new houses without cutting the walls and floors.

More than 50,000 satisfied owners in this country. Call or write for demonstration and list of Caloric users in this section.

# Shelby County Farmers' Directory

## Abbreviations Used in this Directory

a—Acres; Ch—Children; O—Owner; T—Tenant or Renter;  
R—Rural Route; Sec—Section; Maiden name of wife follows  
directory name in parentheses ( ); figures at end of information—year became resident of county. Name of farm follows  
names of children in quotation marks. Star (\*) before child's  
name indicate not at home. In case of a tenant, the farm owner's  
name follows the figures giving size of farm.

## EXAMPLE

**Askins, C. W.** (Alice Holland) Ch Frances, Rosie, Pearl, George, Louis,  
\*Bertha, \*Clement; Trowbridge R1 Big Spring Sec27 T1a Mary  
McClory (1872)

### Means

Askins, C. W.—Name.  
(Alice Holland)—Wife's maiden name.  
Ch Frances, Rosie, Pearl, George, Louis, \*Bertha, \*Clement—Children  
named Frances, Rosie, Pearl, George, Louis; \*Bertha, \*Clement.  
Trowbridge R1—Postoffice Trowbridge, R. F. D. 1.  
Big Spring Sec27—Big Spring township, Section 27.  
T1a—Tenant on 1 acre.  
Mary McClory—Owner's name  
(1872)—Lived in county since 1872.

# Oakbrook Farm Durocs

Established 1905

Durocs excel in quality, size, prolificacy and ability to make profitable use of a great variety of feeds. The care used in developing the Oakbrook Duroc Herd is convincingly set forth by this list of sires used.

Ben Gold Cloud 63613	Col. Notcher 123773
Oakbrook Buddy 85367	King Col. S. 44121A
W. & F.'s Col. 18129A	Superba III 50533A
Helon's Ohio Chief 74735	Pal's Fancy Col. 64455A
Muncie Col. 85571	Pathfinder Lad 240653

PRODUCTIVE SUPERIOR STOCK AND MODERATE PRICES

## SHORTHORNS

The popularity of Shorthorns throughout the middle west indicates that no other breed equals them as profit-makers, under our conditions, prominent among which are heavy crops and scarcity of help. Perhaps we could better spare all other breeds than this one premier race of cattle. To a superlative degree they combine high quality with large size beef-making tendency with milk-producing ability in a short utility and beauty with a pleasing disposition. We are using the good Scotch Bull Merry Archer 630331. Come, write or phone.

C. G. OAKES - ASSUMPTION, ILL.

### MANUFACTURER'S CHARACTER

The manufacturer of a well known brand has more at stake in maintaining his quality than if he is manufacturing the same product to be sold under private brand. In the former case, he must please a consumer whom he never sees; in the latter case he transfers the responsibility to a retail merchant who deals face to face with the consumer and who can plead his case in person, in case of dissatisfaction.

# PICKER'S

Assumption's Greatest Clothing  
Store

For over twenty years this store has set the standard for style and value in this district.

We sell and recommend the following Triple - Guarantee Goods: Hart, Schaffner & Marx Clothes, Clothcraft Clothes, No-Name Hats, Wilson Bros. Shirts, Bostonian Shoes, Munsing & Cooper Underwear.

Both Mutual and Assumption  
Telephones  
Assumption Illinois

# PROTECT YOUR HONEST DOLLAR

To Prairie Farmer Readers—

Don't buy cheap, unadvertised goods, but protect yourself when buying by insisting on getting from your dealer only—

All Goods Advertised in Prairie Farmer are TRIPLE-G Goods.  
All Goods Advertised in This Directory are TRIPLE-G Goods.

When the local dealer says in his advertisement:

## "We Sell and Recommend the Following TRIPLE-Guarantee Goods"

as in any advertisement in Prairie Farmer or in this  
Directory, it gives you this TRIPLE-Guarantee

- 1st That the manufacturer of the goods stands back of them.
- 2nd That the Prairie Farmer stands back of them.
- 3rd That the merchant handling the goods stands back of them.

## "**TRIPLE-Guarantee Goods**"

*Are the best value for the money.  
Safest to buy.  
And Satisfaction is absolutely insured.*

# What Are "TRIPLE-G" Goods?

©  
PF  
1918

**WHY** should you ask  
for them and  
refuse any other kind?

WHEN a reader of Prairie Farmer goes into a store to buy, he is assured of getting full value for his money if he insists on buying only well known advertised goods and refusing to buy any unknown brand substitute.

**WHY?** Because advertised goods are well known goods that are backed up with the guarantee of PRAIRIE FARMER and the manufacturer. If the goods are not as represented in the advertising, or do not give full satisfaction, this TRIPLE GUARANTEE means that you have only to make your complaint and that any just claim will be fairly considered and your money paid back in case the goods are not as represented. This is PRAIRIE FARMER'S FAIR PLAY POLICY with its readers. We back up every advertisement in PRAIRIE FARMER and guarantee honest treatment. No humbugs, swindles or cheap substitute goods (that are made to sell and get the customer's money on false pretenses) are advertised in PRAIRIE FARMER. Buy the goods advertised in PRAIRIE FARMER and in this Directory and you are taking no chances. You are guaranteed satisfaction because all goods we advertise are

## "Making Hay While The Sun Shine"

*The Farmer—*

who studies diversified farming.  
who practices crop rotation.  
who equips his farm with more and better  
live stock.  
who puts forth every effort this year for  
increased production.  
and who banks with this Institution  
*is "making hay while the sun shines."*

This Institution cordially invites Farmers' Accounts. Under Supervision Auditor Public Accounts.

He is taking advantage of the practical measures that will increase both his farm output and his farm income.

American Fence

We furnish FREE plans and estimates on all buildings

## IT PAYS TO BUY AT AN R. C. U. STORE

Of course, it is quite possible that other stores say this very thing about themselves.

So it will do no harm to emphasize the wide chasm that separates the policy of this store from all others in this city and the entire vicinity.

Our goods are bought on a tremendous scale. Instead of dozens—thousands. Instead of pounds—tons.

And when 600 R. C. U. merchants get together to buy something, no one single store can enter into competition.

Have you tested this R. C. U. store for its value giving?

## Why Your Choice Should Be a Victrola

No matter what machine you buy, you are going to use Victrola Records, or miss what is best in the World of Music. This being the case, isn't it the plainest kind of common sense to choose the machine that will play most perfectly the records you are going to use. There is only one machine that will play Victrola Records perfectly—"The Victrola."

It's easy to own a Victrola. Let us explain an easy payment plan.

**What About  
Your Car —**

If you have never had us do any work for you, let us do some. If you have ever had us work for you, let us do some more. If you have ever had us do work for you, and it was satisfactory, you certainly appreciated it, and if the work was not satisfactory, we would greatly appreciate it if you would bring it back, and let us make it satisfactory, then we would all be satisfied.

We thank you for past patronage and ask you for more in the future.

In addition to being a source of pleasure to every member of the family a car saves lots of time when time is money. When you need something from a distance and need it quick, a good car will have it there without loss of time. For whatever purpose you want a car it will pay you to see us.

### ERADICATING HEDGE

By Frank L Mann in Prairie Farmer.

You can not kill a hedge fence entirely by burning or cutting off the tops during the winter or spring. There is so much stored material in the roots to be used in making growth that the roots or stumps will start buds and grow the coming season. If you could cut it or burn it during late summer or early fall—during August in this latitude—after the growth has been made and before the wood has begun to harden, most of the plants will be killed, if not all.

To get rid of a hedge, however, it is not a bad plan to burn it or cut it off close to the ground during the winter when there is more time to work at it, and depend on cutting off the new growth that comes once or twice during the next summer. One close cutting should be made in August, just before the wood commences to harden, so that this young growth is not permitted to store any food in its roots for another year. If all tops have been burned or cut close

to the ground the new growth next summer may be kept down without much work by cutting off with a mower or heavy scythe. A close cutting throughout one summer and fall will usually kill all the hedge, though sometimes an occasional plant may show another year. If not allowed to mature any wood during the fall the hedge or any plant is easily killed. If your hedge is where you can permit it to grow it would pay to let it grow for posts. It will pay more per acre than your corn land.

### KILLING RATS.

From Prairie Farmer.

Saturate cloths large enough to fill the entrances of the holes with carbon-disulphide, perhaps a large tea-spoonful to each cloth. Poke the cloth down as far as possible, then fill in with dirt. This gas is very heavy and when it evaporates it settles into the bottom of the holes, killing old and young. This gas is also very satisfactory in killing gophers and woodchucks.

When you go into a store to buy shoes, say to the clerk, "I want a pair of \_\_\_\_\_ shoes". Don't say, "I want a pair of shoes". If you name a brand of shoes you know will give you satisfaction, you not only say you want shoes, but you know about what you want. A clerk will always give closer attention to a customer who knows what he wants. It is human nature. The clerk will be more likely to give you satisfaction, even if he does not have the make of shoes you ask for, because he will know better what to show you, if you are willing to consider another make.

## PRAIRIE FARMER'S RELIABLE DIRECTORY

THE Shelby County Farm Bureau was organized last winter and spring by state organizers from the Agricultural Extension Service of the State University. Owing to bad weather the roads were almost impassable and the difficulties of organization were greatly increased.

However, those difficulties are being overcome and the Farm Bureau is now a well established institution in this county. The County Agricultural

Agent assumed his duties in this county June 1, 1918.

The Farm Bureau is an organized agricultural democracy, by means of which farmers and their families express themselves concerning all matters relating to the advancement of agricultural, home and community life. The Bureau is recognized by law as a public agency for doing extension work. It establishes the same relationship between the County Farm Bureau and the United States Department of Agriculture as exists between the State Agricultural College and the United States Department of Agriculture. The Farm Bureau cooperates with the United States and the State Departments of Agriculture in all extension in the county whether that work be farm crops, soils, farm animals or the problems of the home and community life. Instead of being merely an aid to county-agent work, the Bureau has become a local institution, educational in character, for administering and directing the extension work in agriculture and home economics.

The people in an organized capacity have thus become full partners in all that is undertaken in the county for the improvement of agriculture and the advancement of home life. Through the Farm Bureau they have assumed a responsibility which properly belongs to them, i. e., that of directly participating in determining what shall be undertaken, in helping develop the plans, and in personally

MR. BELTING

assisting in carrying out the Agricultural Improvement Program. The realization of this ideal has been made much easier by the impelling necessity of the war.

### Benefits of the Farm Bureau

1. The members are brought closer together in a business and social way.
2. Fosters and develops co-operation.
3. Gives the farmer the best of scientific agriculture.
4. Helps in the solution of farm problems.
5. Better marketing of farm products.
6. Enables members to buy feeds and fertilizers at wholesale prices.
7. Investigates and protects farmers from fakers and fraudulent concerns.
8. Develops the most profitable and permanent system of agriculture.
9. Through organized efforts the total agricultural production will be increased.

### Program of Work for Shelby County

- A. SOILS:
  1. Liming.
  2. Fertilizers.
  3. Humus—Legumes for Soil Improvement.
  4. Drainage.
  5. Prevention of Washing.
  6. Management of Different Soil Types.
- B. CROPS:
  1. Insect and Disease Control.
  2. Improved Varieties.
  3. Selection and Storing of Seed.
  4. Best Cultural Practices.
  5. More Legumes.
  6. Pasture Mixtures.
  7. Weed Control.
  8. General Crop Improvement.
  9. Orcharding.
- C. LIVESTOCK:
  1. Better Sires.
  2. Breeder's Associations.
  3. Dairying—Cow Testing.
  4. Small Flock of Sheep on Every Farm.
  5. Feeding Problems.
  6. Animal Diseases.
  7. Increased Hog Production.
  8. Exhibits at Fairs.
- D. FARM MANAGEMENT:
  1. Farm Accounting.
  2. Farm Systems Planned.
  3. Crop Rotations Planned.
  4. Farm Improvements.
- E. GROUP WORK:
  1. Demonstration Meetings.
  2. Farm Tours.
  3. Local Group Meetings.
  4. Farmer's Institutes.
- F. MISCELLANEOUS:
  1. Farm Labor Problems.
  2. Boys' and Girls' Club Work.
  3. Planning Farm Buildings.
  4. Farm Projects.
  5. Farm Homes.

## HOW TO MEND THE HAY ROPE

By C. O. Reed, University of Illinois in Prairie Farmer.

To repair a broken or badly weakened strand, complete the break as shown in Fig. 1 and unlay each end of the strand back about 2 feet as

shown at A and B in Fig. 2. Take a strand about five feet long from a piece of rope exactly the same size as the hay rope, and lay it into the

Fig. 1. A Broken Strand to Be Repaired.

Fig. 2. Ready to Lay In the New Piece

Fig. 3. Starting to Lay In the New Strand in Repairing a Broken Strand

# Merit Wins

The service this store renders is one of this county's valuable assets. "We miss Bolinger's store most," has been the statement of many people moving elsewhere.

Furnishers of Things to Wear and Things to Eat  
for the Whole Family

Also Floor Coverings and Draperies

G. W. BOLINGER & SON  
SHELBYVILLE ILLINOIS

## Keep Your Good Cow

Whether she is Ayrshire,  
Brown Swiss, Guernsey, Hol-  
stein or Jersey.

BE PROGRESSIVE—Milk cows—Use a cream separator—Feed the warm skim milk to Calves, Pigs and Poultry—Sell your cream—All these will bring you a daily income.

DELIVER OR SHIP TO
